CULINARY COMMAND

# FACULTY PRESENTATION

## THE TEAM

Matayas Durr  
Software Engineering

Frontend Developer  
& Client Liaison

Wyatt Hunter  
Software Engineering

Backend &  
Architecture Lead

Kevin Tran  
Software Engineering

Backend Lead /  
Security &  
Infrastructure

Anthony Phan  
Software Engineering

Frontend & UI/UX  
Developer

Ryan Rockey  
Software Engineering

Frontend & UI/UX  
Developer

# The Core Problems Restaurant Teams Face

Restaurant owners often deal with chaotic paper lists and scattered spreadsheets to manage their restaurant.

Culinary Command serves as a platform that streamlines the restaurant management process to cut waste, boost efficiency, and compete head-to-head with larger chains by addressing:

## Unreliable Prep Tracking

- Many restaurants still depend on paper notes, whiteboards, or memory.
- This leads to inconsistent prep amounts, last-minute scrambling, and wasted time.

## Unclear Task Assignment

- Managers don't always have visibility into who owns each task.
- Work gets duplicated or missed, and communication has to happen in the middle of a rush.

## Limited Operational Insight

- Prep work, inventory usage, and staff workload aren't tracked in one place.
- Owners can't easily see trends or make data-driven decisions about ordering and staffing.

Culinary Command is designed to replace these fragmented processes with a single, structured system.

# OBJECTIVES

## 01

### Ease of Use

The team wants to create a central location for restaurant owners to seamlessly manage their restaurant.

## 02

### Prep List Management

Owners will be able to manage preparation lists/tasks for employees

## 03

### Ingredient and Recipe Catalog

For each restaurant, there will be a catalog to view ingredients and recipes.

## 04

### AI Integration

Utilize prehistoric data to make predictions about business conditions

# REQUIREMENTS

Custom recipes for individual restaurants

Inventory Management System tracking ingredients and stock

Task Management System for assigning tasks to employees

Independent dashboards for each employee

AI predictions on new stock orders and sales

Customization for individual owners/restaurants

# TECH STACK

## Culinary Command Tech Stack

### FRONTEND & BACKEND

ASP.NET: web/API framework

Blazor: C# web UI framework

Playwright / bUnit:  
End-to-end and unit testing

### CLOUD INFRASTRUCTURE

Amazon Lightsail

Amazon RDS MySQL

### VERSION CONTROL & CI/CD

GitHub

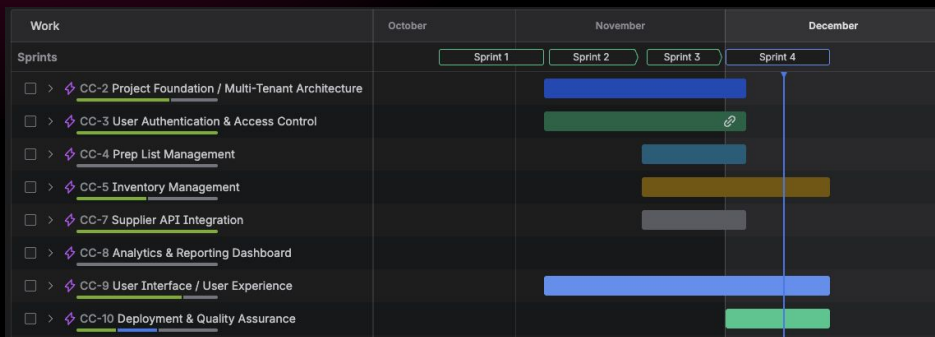

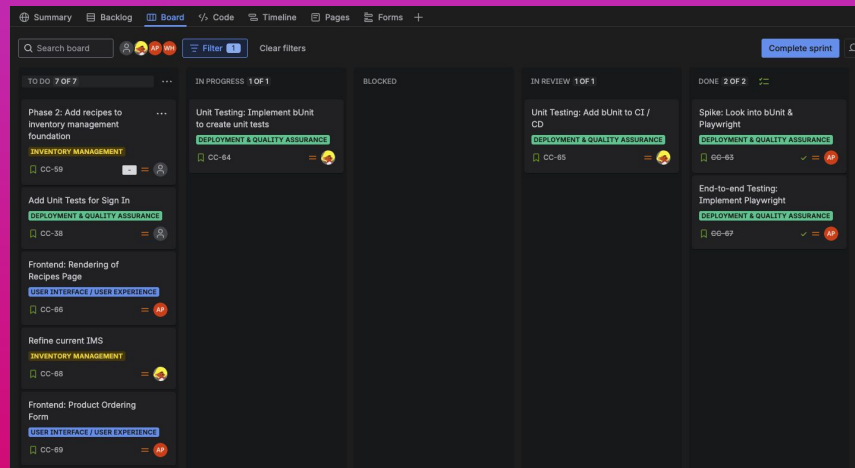

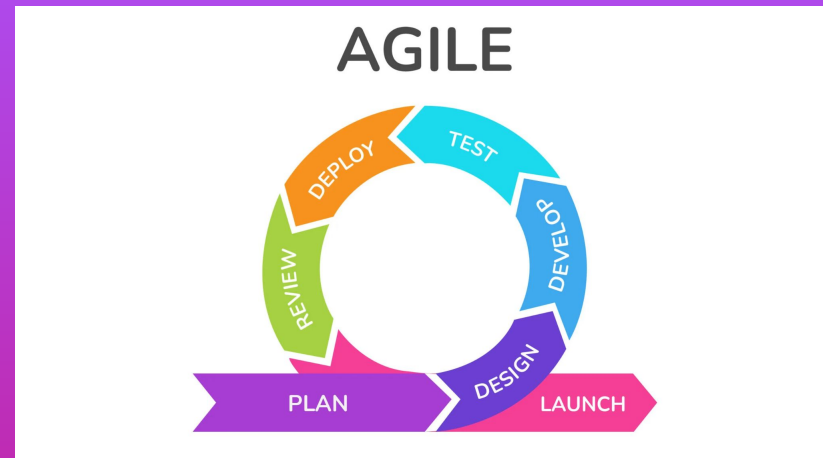

Terraform

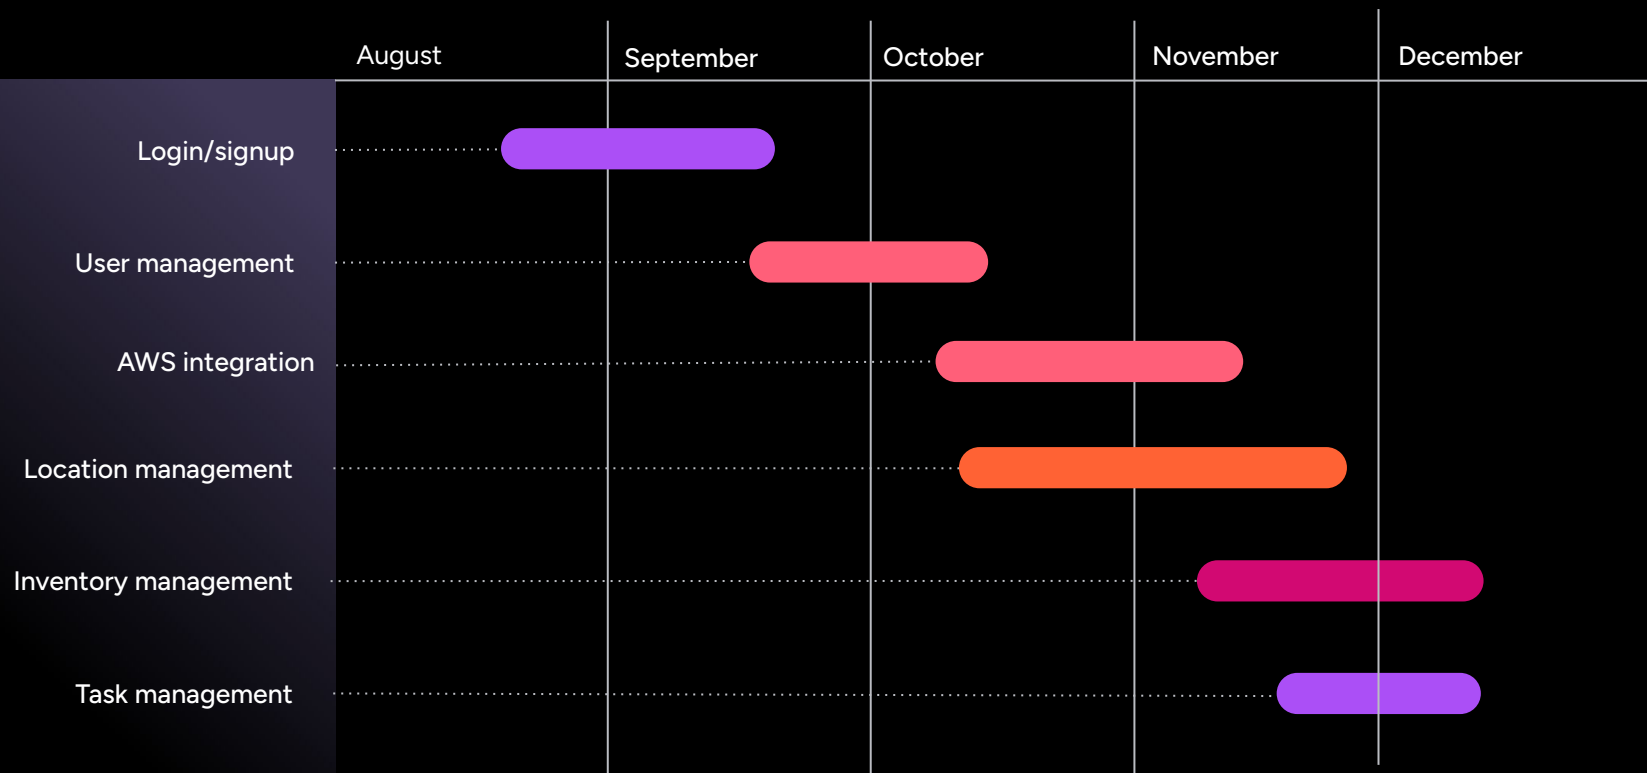

GitHub Actions

# AGILE FRAMEWORK

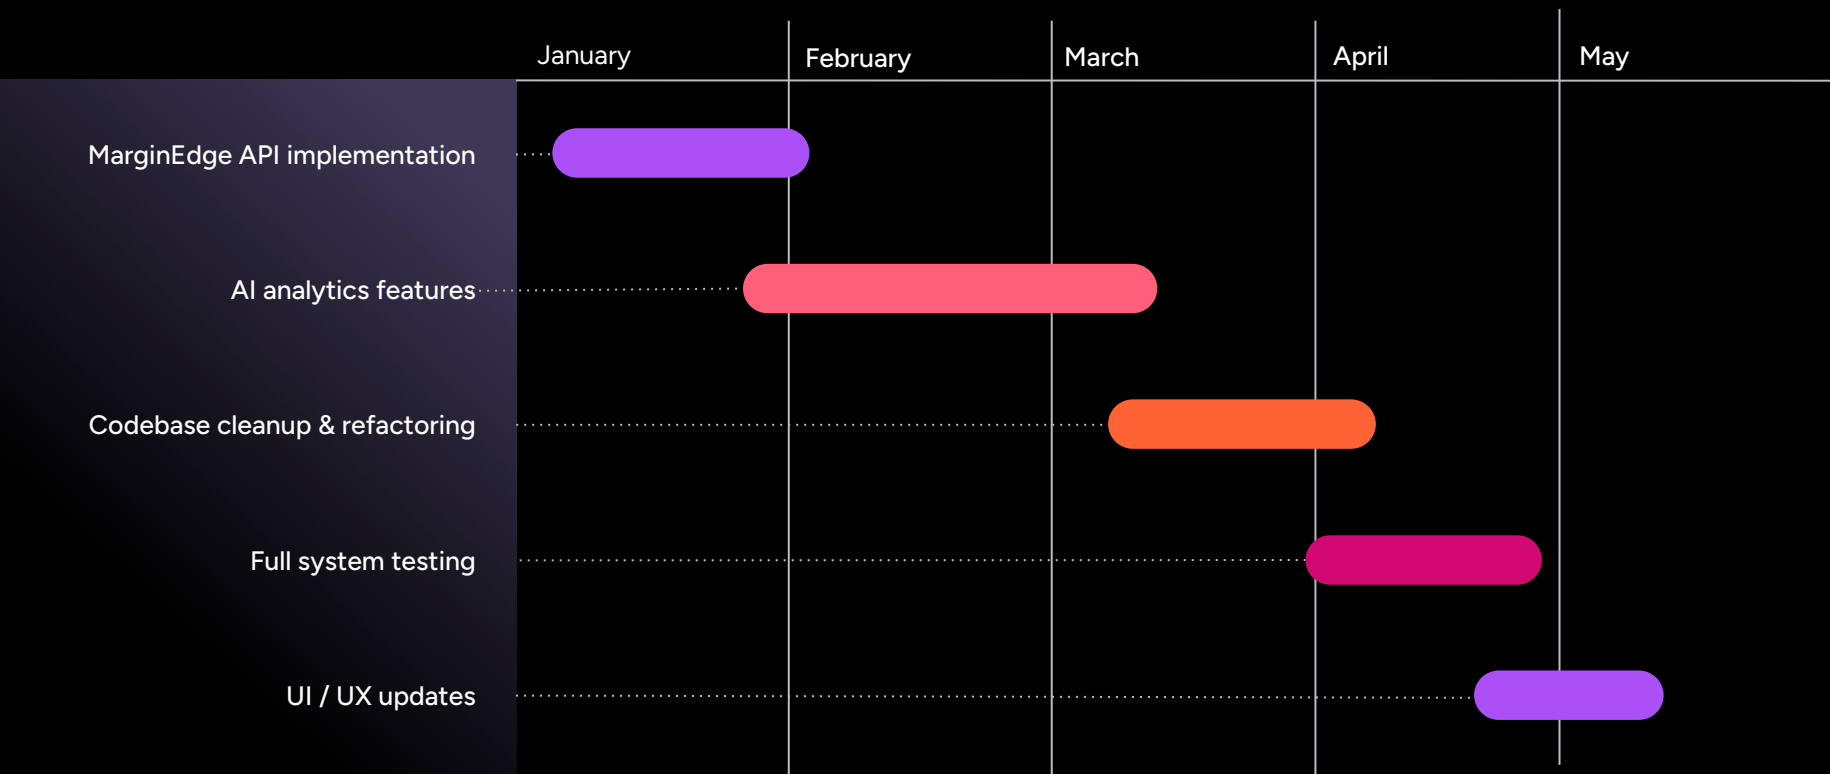

- Project management approach that emphasizes collaboration and continuous improvement to deliver value to customers.
- Weekly meetings to discuss progress, issues, and priorities.
- Two week sprints.
- Jira

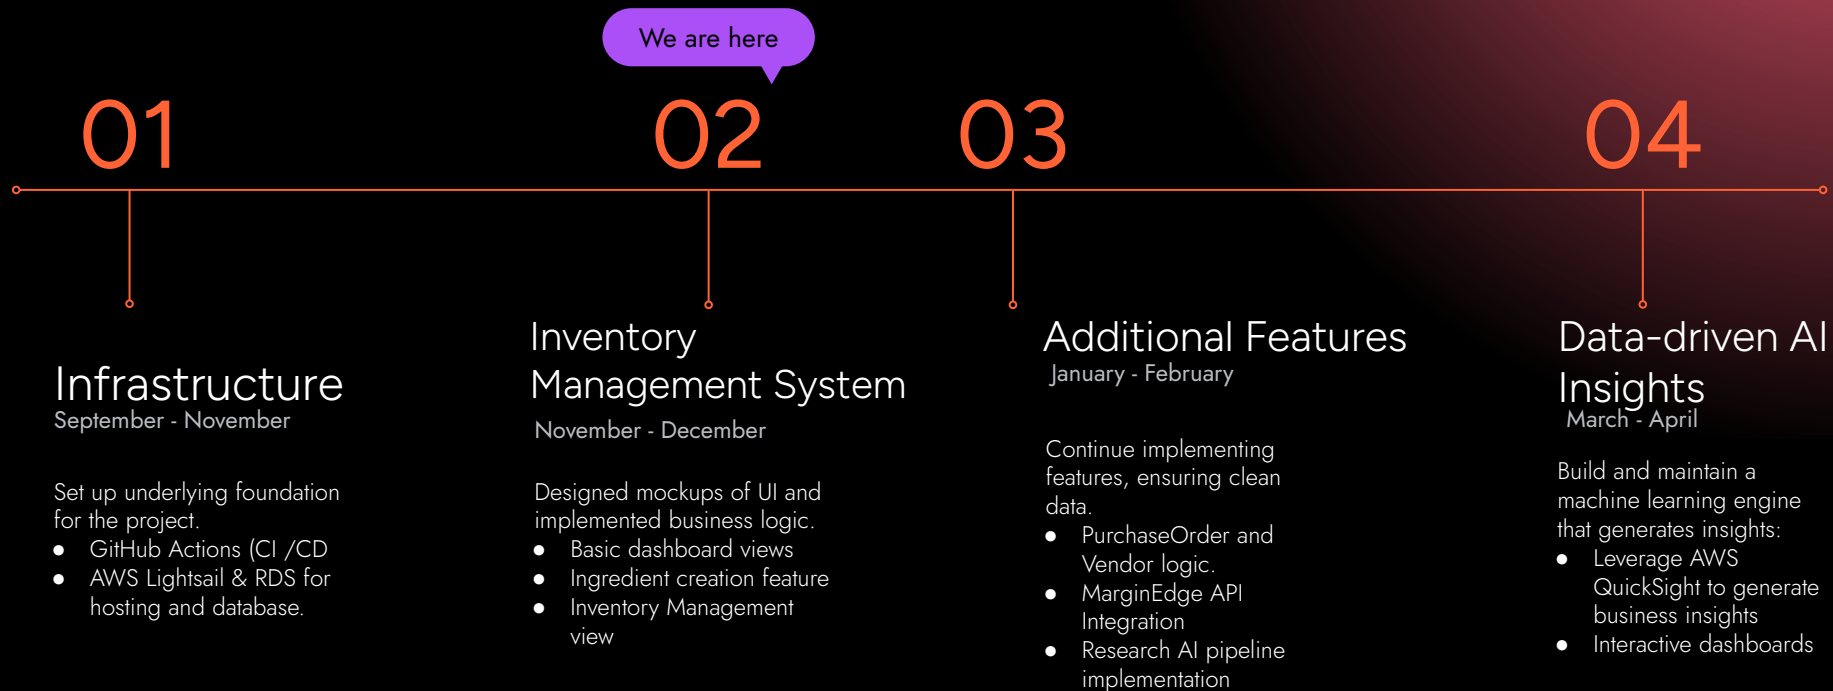

# PROJECT TIMELINE (FALL SEMESTER)

# PROJECT TIMELINE (SPRING SEMESTER)

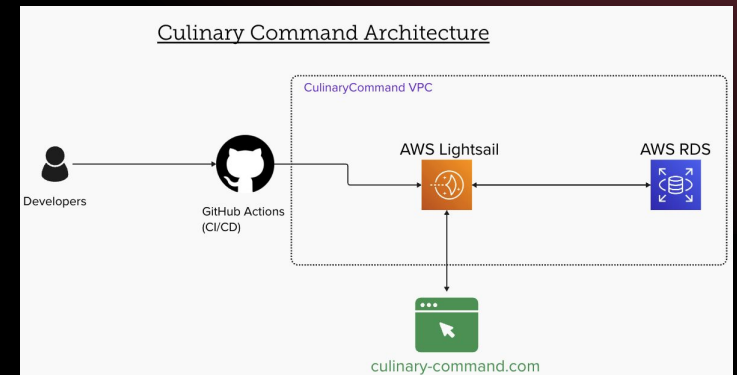

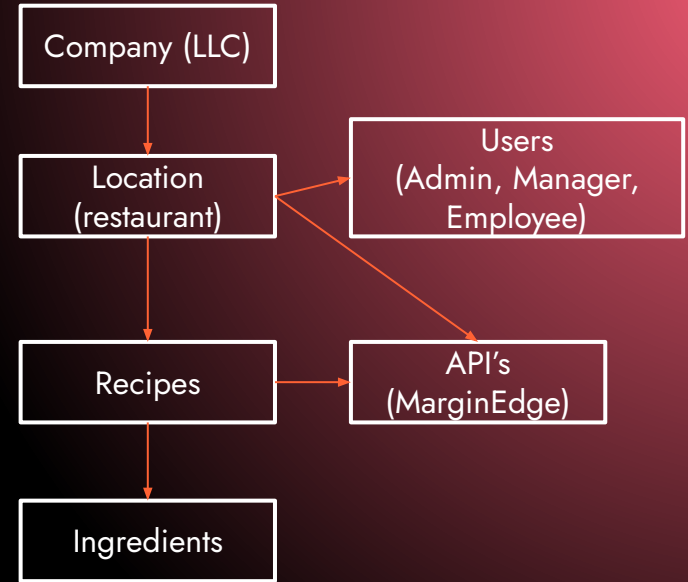

# PROJECT TIMELINE

# HIGH LEVEL ARCHITECTURE

## Three Layered Structure:

- Front End - Blazor Server
  - Interacts with the back end
  - Role-Aware
  - Real-Time rendering
  - Uses dependency injection
  - Stateless services (Auth, Location)
- Application Back End - ASP.NET Core
  - Business Logic
    - Authentication & Auth.
    - Location/Company Scoping
    - Inventory (recipe/ingredient)
  - Service Layer (UserService, RecipeService)
  - EF Core domain models mapping to the database
- Data & Infrastructure - AWS
  - AWS RDS - Stores all data
  - AWS LightSail: Host Blazor Server & API
  - EF Core Migration
  - Designed for Multi-Tenant separation at Company

## GitHub Actions

### Pipeline features:

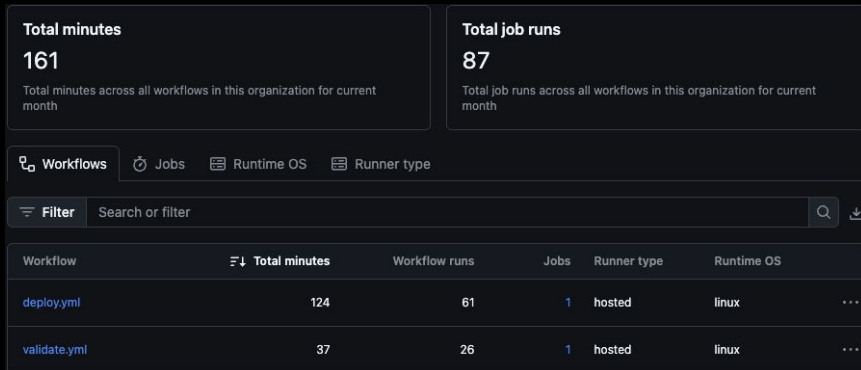

- Automatic unit tests
- Database schema migrations
- Server deployment
- AWS resource deployments using Terraform

### Benefits:

- Improved code quality
- Reduced debugging time
- Increased development speed
- Consistency

# CI/CD via GitHub Actions

## Usage Metrics:

## Performance Metrics:

# DESIGN – FRONTEND

## What we wanted:

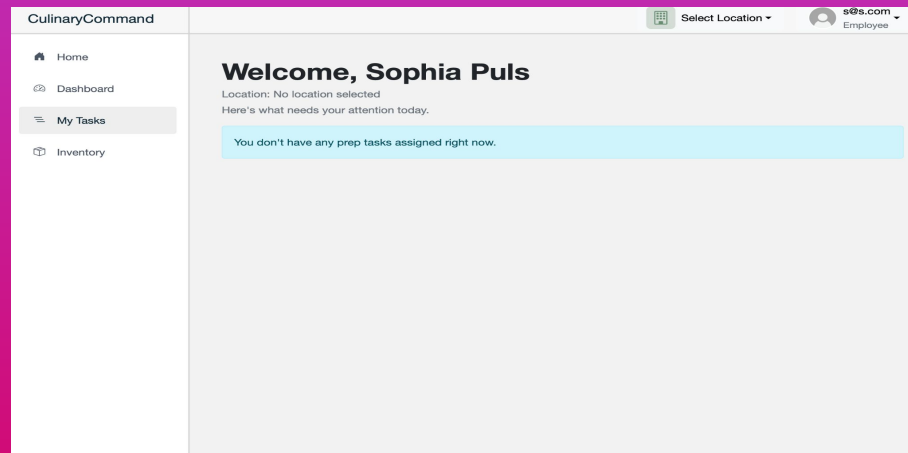

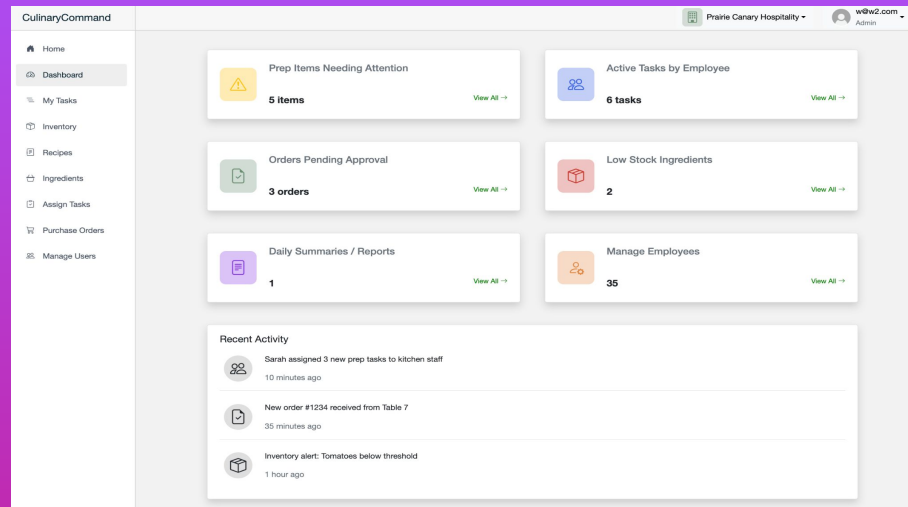

- A UI that doesn't make restaurant staff want to throw their device into the fryer.

## So we built it to be:

- Super Clean: nothing extra on the screen
- Touch Friendly: big buttons, big spacing and works on tablets.
- Fast to Use: every action should take about 1-2 touches on average (Admin is little different when setting things up).
- Consistent: same layout everywhere so no getting lost (unlike aws)
- Chef-Approved: easy enough for a busy line cook to use

## How the UI is Organized:

- Left Menu = kitchen tool belt
- Top Bar = your restaurant/company and account settings
- Main Page = the action
- Simple Colors: Green means good, red mean check it out.

# DESIGN – FRONTEND CONT.

## Inventory Page

- Feels like a grocery list but smart
- Tap +/- to adjust quantities
- See low, high or out of stock items, no surprises
- Mapping to recipes, ingredients and other inventory items.

CulinaryCommand

Prairie Canary Hospitality

w@w2.com Admin

### Inventory

+ Add Item

All Dry Items Arriving Soon Ordered Filter List

NAME	SKU	CURRENT QTY	OUT OF STOCK	LAST ORDER	PRICE	ACTIONS
Milk		2,000 liter	-	-	\$0.00	
Egg		2,000 each	-	-	\$0.00	
Salt		14,000 gram	-	-	\$0.00	

TOTAL ITEMS: 3

LOW STOCK: 0

OUT OF STOCK: 0

TOTAL VALUE: \$0.00

## Recipe Page

- Pretty, simple recipe display
- Ingredients exactly how cooks want them
- Clear automated steps so no confusion
- Great for training new staff or standardizing dishes.

Fluffy Eggs

← Back

Category: Produce

Type: Side

Yield: 100 Each

### Ingredients

- 3 each — Egg
- 0.1 liter — Milk
- 0.1 gram — Salt  
Just a pinch

### Steps

- Crack open the eggs into a bowl
- Pour the milk and a pinch of salt into the bowl with eggs.
- Whisk until milk is whisked into the eggs.

# DESIGN – FRONTEND CONT.

## Task Assignment Page:

- Managers/Admins create tasks in seconds
- Maps to My Tasks page for assigned employee.
- Assigned to stations or specific workers
- Kanban style - "pending", "In Progress", and "Done"
- Real-time updates so no time is wasted

## User Management:

- Add locations, employees/managers, editing
- Promote, demote, and remove with one click
- Make multi-restaurant management actually manageable and visually appealing

The screenshot shows the 'Task Assignment' page in the CulinaryCommand application. The page is titled 'Task Assignment' and includes a sub-header 'Plan the line, prep, and cleaning tasks for today.' The main content area is divided into two sections: a form for creating a task and a Kanban-style task board.

**Create a task** (Team: 1)

Assign work to a team member with an expected due date.

**Task type**

General type (line, cleaning, etc.)

Use "Prep from recipe" when you want it to show on the prep list with Par / Count.

**Task name**

**Station** (Prep) **Priority** (Normal)

**Assign to** (Unassigned) **Due date** (12/09/2025)

**Notes**

Add any details or prep targets

**Assign Task**

**Task Board:**

- Open tasks** (Due today): 0
- Pending**: 0 (No tasks in this column.)
- In Progress**: 0 (No tasks in this column.)
- Completed**: 0 (No tasks in this column.)

Search tasks or people

The screenshot shows the 'Settings' page in the CulinaryCommand application. The page is titled 'Settings' and includes a sub-header 'Manage your account preferences.' The main content area is divided into two sections: 'Company Locations' and 'Users Assigned to This Location'.

**Company Locations**

**Prairie Canary Hospitality**

14622 South 20th Avenue East  
Geneseo, IA 50112

**Users Assigned to This Location**

**Invite New User**

First Name (Sophia) Last Name (Puls)

Email (s@w.com)

Role (Manager)

**Send Invite** **Cancel**

**Users List:**

Name	Email	Role
Wyatt Hunter	w@w2.com	Admin

**Promote** **Remove**

# TESTING

Our goal is deliver a restaurant management system that is reliable, secure, and maintainable through comprehensive testing

## Unit Testing

- Using bUnit, compatible with Blazor
- Test individual components in isolation
- Ensure the verification of logs and data
- Check edge cases and error handling

## End-to-End Testing

- Using Playwright xUnit end-to-end testing
- Works seamlessly server side with Blazor
- Helps with role based testing, catches bugs early
- One command will run all tests and return with test results

## Future of Testing

Expand testing coverage and leverage AI to predict and prevent issues before they occur

- Service Tests
- Authentication Tests
- Device Compatibility Testing

# RISKS AND MITIGATIONS

## User Feedback

Our pseudo-client, Paul Durr, has provided valuable insight into real restaurant workflows based on his experience operating multiple locations. However, our team has not yet conducted formal user testing or regular feedback sessions.

- 
- Early feature discussions with Paul helped us understand pain points around prep lists, task assignment, and inventory management.
  - Without consistent feedback during this phase, some assumptions about restaurant workflows may need adjustment once real users interact with the system.
  - Next semester, structured user testing with Paul and his staff will help validate our designs and guide refinements to ensure the platform fits real operational needs.

## Limited Technical Experience

- Our team is still learning new tools at the same time we're building the system – Blazor, Playwright, .NET, AWS, AI, LightSail, and Margin Edge. With everyone picking up a unfamiliar tech, development can possibly slow down, mistakes can happen more easily, and certain features take longer than expected.

- 
- Experienced teammates actively mentor others on Blazor, AWS, and testing tools.
  - Use code reviews and automated testing via GitHub Actions to catch mistakes early.
  - Pair teammates up on features so no one learns new tools alone
  - Document pitfalls or problems in the shared communication channels

## Integration Delays

When a system gets ahead of another (frontend, backend, or AWS), features can get stuck waiting. Small API change or late endpoint delivery can stall entire UI sections. These delays slow down development and increase work.

- 
- Lock down model structures so both teams know exactly what data shape to expect.
  - Mock data and a staging environments so the frontend can keep moving even if the backend isn't ready yet.
  - Weekly integration check-ins help catch breaking changes before they hit main.
  - For example, a backend update to the Recipe model can instantly break multiple UI pages if it isn't communicated earlier.

# CONCLUSION

## What We Accomplished

### Foundational Progress

- Built core infrastructure on AWS (Lightsail + RDS)
- Implemented authentication and multi-location support
- Developed inventory management with full CRUD
- Established consistent UI/UX foundations across pages

## Where We're Going Next

### Next Semester Focus

- Complete task management and assignment workflows
- Integrate MarginEdge API for real restaurant data
- Expand automated testing (unit, integration, E2E)
- Refine UI for managers, staff, and multi-location workflows

## Long-Term Vision

### Final Deliverable

- Deliver a polished, production-ready platform
- Provide data-driven insights using AWS QuickSight
- Support real restaurant pilot testing
- Empower owners and staff to streamline operations

# Q & A
